WHY TUFF STUFF?

Creep fed calves have better developed rumens due to starch and fibre. This allows calves to **grow both better and bigger** compared to non-creep feed calves. Creep fed calves generally **weigh more** than non-creep fed calves. Calves will be bigger framed and more uniform at weaning. Creep feeding also allows **early weaning** of calves. Calves that are fed creep feed are **more bunk adjusted** and will experience **less stress** at weaning and go on feed quicker in the feedlot. Creep fed calves also have **higher immunity** meaning less sickness or morbidity at the feedlot. When finished, creep fed calves tend to marble or **grade higher** than non-creep fed calves. Creep feeding can also help **ease the pressure on pasture forage** by providing another feed source for the calves. Creep fed calves often **command a higher price.**
